## Predictive Services Discussion:

A high-pressure ridge that has brought extreme heat to the West in recent days is centered over the Great Plains today, raising high temperatures up to $10^{\circ} \mathrm{F}$ over yesterday's highs in much of the Midwest and southern Plains. Very hot, dry conditions will also continue over much of the West today as well, except for the Pacific Northwest and western Montana, where temperatures are expected to return to normal or slightly below normal with breezy westerly flow. Strong westerly winds will also extend across the Northern Rockies and much of the northern High Plains and northern Great Plains, where the potential also exists for isolated thunderstorms. Areas near the southern Great Basin, the Four Corners and Northern Arizona will see an increase in winds, combined with single digit relative humidity and well above normal temperatures to create elevated conditions. Isolated thunderstorms are likely across central and south Texas and along the Gulf Coast, while scattered thunderstorms with the potential for severe thunderstorms with damaging winds and large hail are possible in the Upper Mississippi Valley and the western Great Lakes. Heavy rain persists across central and south Florida with areas of flooding possible.

## National Predictive Services Outlook

## 6 Minutes for Safety:

The 6 Minutes for Safety topic of the day is Initial Attack Sizeup/Safety.
