Predictive Services Discussion:

A deep upper-level trough will move into the Pacific Northwest. The cold front associated with this system will move into northern California, the Great Basin, and into the Northern Rockies through the day. Ahead of this front, very strong winds will develop over the Intermountain West, and especially across the Great Basin. Sustained west to northwest winds of 20 to 30 mph are expected to develop by early afternoon. Gusts will be 30 to 45 mph, with localized gusts exceeding 50 mph or more exposed ridges and mountain passes from the Sierra through the Great Basin and along the Sierra Front. Relative humidity will drop to 5 to 25%, resulting in widespread critical fire weather conditions. Cooler temperatures and higher humidity are expected behind the cold front, along with wetting precipitation from the Cascades through much of Oregon into the northern Rockies.

In the Southeast, winds will be increasing from Louisiana into Tennessee as Hurricane Francine approaches, with landfall expected in the afternoon. Wind gusts of 20 to 25 mph and relative humidity of 20 to 30% are expected in the Tennessee Valley, while the Louisiana coast sees hurricane force winds and heavy rain. Elsewhere in the east, temperatures will continue to increase as high pressure settles over the Great Lakes, with much of the eastern US likely to remain dry outside the effects of Francine.
